No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Sequence 8382, Application US/60522459
Sequence 8382, Application US/60522459
GENERAL INFORMATION:
TOTALE OF INVENTION: USE BIOINFORMATICALLY DETECTABLE GROUP OF NOVEL REGULATORY VIRAL AND TITLE OF INVENTION: USE SOCIATED OLIGONUCLEOTIDES AND USES THEREOF
FILE REFERENCE: 52004
CURRENT APPLICATION NUMBER: US/60/522,459
CURRENT FILING DATE: 2004-10-04
NUMBER OF SEQ ID NOS: 15575
SOFTWARE: Patentin version 3.2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           US-60-522-459-14443

Application US/10852943

Sequence 17. Application US/10852943

GENERAL INFORMATION:

APPLICANT: University of Geneva

APPLICANT: Bettsch, Samuel

TILLE OF INVENTION: METHOD FOR DETECTING DISEASES CAUSED BY CHROMOSOMAL IMBALANCES

FILE REPERENCE: 27067/2005

CURRENT APPLICANTION NUMBER: US/10/852,943

CURRENT PILING DATE: 2004-05-25

PRIOR APPLICATION NUMBER: US 60/300,266

PRIOR APPLICATION NUMBER: US 10/177,063

PRIOR APPLICATION NUMBER: US 10/177,063

PRIOR FILING DATE: 2002-06-21

NUMBER OF SEQ ID NOS: 98

SEQ ID NO 17

LENGTH: 16

COMMENT

```
was hydrodynamically sheared by repeated passage through was hydrodynamically sheared by repeated passage through was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gelectrophoresis. Vector DNA was prepared from a derivative of pWD42 (gil4732114 gb|AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent B. coli XI10-GGold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Contact: Robert Strausberg, Ph.D.

PCR was performed on DNA from transformants of Arabidopsis thaliana plants from INRA (Versailles). The DNA fragment(s) resulting from the PCR were directly sequence from the left or the right border to determine the genomic sequence flanking the insertion. T-DNA derived sequences were removed. Information to order the corresponding mutant line and a link to a database providing a graphical display of the insertion site are available at http://dbsgap.versailles.inra.fr/publiclines/. This sequence has been generated in the framework of the French plant genomics program 'Genoplante' (http://www.genoplante.com and http://genoplante-info.infologen.fr).

Brown RAM (Versailles). The DNA fragment (8) resulting from

the plants from INRA (Versailles). The DNA fragment (8) resulting from

the PCR were directly sequenced from the left or the right border

to determine the genomic sequence flanking the insertion. T-DNA

derived sequences were removed. Information to order the

corresponding mutant line and a link on a database providing a

graphical display of the insertion aite are available at

http://dbsgap.versailles.inra.fr/publiclines/. This sequence has

been generated in the framework of the French plant genomics

program 'Genoplante' (http://www.genoplante.com and

http://genoplante-info.infobiogen.fr).

FOR was performed on DNA from transformants of Arabidopsis thaliana

plants from INRA (Versailles). The DNA fragment(s) resulting from

the PCR were directly sequenced from the left or the right border

to determine the genomic sequence flanking the insertion. T-DNA

derived sequences were removed. Information to order the

corresponding muteant line and a link to a database providing a

graphical display of the insertion site are available at

http://dbsgap.versailles.inra.fr/publiclines/. This sequence has

been generated in the framework of the French plant genomics

program (Genoplante', (http://www.genoplante.com and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
